

# VibeHaus — Design System

Author: Sakshi · Capstone · *Consistent with the PRD, backlog, and the built app.*

## 1. Color Palette

| Role           | Color      | Hex     | Usage rules                                                                                          |
|----------------|------------|---------|------------------------------------------------------------------------------------------------------|
| Primary        | Navy       | #11224E | Headers, navigation, primary buttons, body text on light backgrounds. Dominant color across the app. |
| Accent         | Orange     | #F87B1B | Calls to action, active/selected states, key badges. Accent only — never a large background fill.    |
| Rare accent    | Sage       | #CBD99B | The "Good Vibe" badge (text/border) only. Never a background fill, never a stripe.                   |
| Rare accent    | Olive      | #7A8B55 | Same restrictions as Sage — a stronger version for the same rare use.                                |
| Background     | Off-white  | #F7F5EF | App/page background.                                                                                 |
| Surface        | White      | #FFFFFF | Card surfaces, sitting on the off-white background.                                                  |
| Secondary text | Grey/taupe | #8A8578 | Secondary text, disabled states, dividers, neutral tier labels (e.g. "Future").                      |
| Body text      | Dark text  | #2A2A2A | Primary body copy on white/off-white.                                                                |

**The one hard rule:** navy, orange, and sage/olive must never appear as three equal-sized blocks side by side — this risks an unintended flag-like read. Sage/olive stays confined to one small, isolated element per screen (the Good Vibe badge), never a background, never a stripe, never positioned in a row alongside solid navy and orange blocks.

---

## 2. Typography

- **Case:** sentence case everywhere. No Title Case, no ALL CAPS, except tiny category/tier labels (e.g. "MVP TIER").
  - **Headings:** bold, navy (#11224E).
  - **Body:** regular weight, dark text (#2A2A2A) or secondary grey (#8A8578) for supporting copy.
  - **Weight discipline:** no more than two font weights (regular + bold) visible on any single screen.
  - **Emphasis:** never conveyed by color alone — pair with weight or an icon where meaning matters (e.g. a badge, not just red text).
- 

## 3. Iconography & Imagery

- **Line-art icons:** minimal, single-stroke style throughout (Discover illustrations, empty states, nav icons). Not filled, not cartoon.
  - **One deliberate exception — Mr. Vibe:** a flat, simple character icon, more detailed than the line-art standard, since it needs a distinct assistant identity (comparable to Duolingo's owl). This is the only mascot-style element in the app.
  - **Photography:** real photos for every profile avatar. Never illustrated or stock "person" graphics for actual profiles.
  - **Maps:** a static, non-interactive preview image with a single pin — not a live map integration (that's a Next-phase item, Epic N1).
- 

## 4. Component Patterns

### Cards

- Corner radius: 12–16px.
- Background: white or off-white.
- Border/shadow: subtle, never heavy drop shadows.

## Buttons

- Primary: solid navy fill, white text.
- Accent CTA: solid orange fill, white text (e.g. "Find My Vibe," "Send Vibemate Request").
- Secondary: outline/ghost style, navy text.
- Destructive: clearly labeled text (e.g. "Yes, cancel" / "Yes, remove"), paired with a neutral escape option ("Keep it" / "Keep them") — never a bare "OK/Cancel."

## Badges & Bands

- Vibe Score bands (Strong Vibe / Good Vibe / Potential Vibe): orange for Strong, sage/olive for Good (the one rare-accent exception), grey/outline for Potential.
- **Always paired with a plain-language reason** — never a bare percentage or an unexplained badge.

## Filter chips

- Pill-shaped, sticky (pinned below the header while scrolling).
- Active state: solid navy fill. Inactive: outline.

## Empty states

- Icon (line-art) + one warm, encouraging sentence. Never a blank screen.
- Example: "No Vibemates yet 🌱 — Say hi to someone on Discover. Accepted requests land here."

## Confirmation dialogs (destructive actions)

- State the consequence plainly in one sentence (e.g. "This can't be undone").
- Two clearly labeled buttons, never generic "OK/Cancel."

**Profile display — three relationship-based states**, checked live on every open, never cached:

1. **Already Vibemates:** Chat, Coffee Vibe, Activity Vibe, Remove, "... " (Block/Report).
  2. **Pending** (a request sent/received, undecided): full profile info, but Accept/Decline (incoming) or a plain "Pending, awaiting their response" status (outgoing) — no engagement buttons yet.
  3. **Not connected:** heart (Like) and bookmark (Save) only.
- 

# 5. Layout & Spacing

- **Mobile-first:** every screen designed for phone width first; this is a responsive web app, not a native app (see PRD §1, Epic J2 for the native roadmap item).
  - Single-column layouts throughout.
  - Card-to-card spacing: 12–16px.
  - Sticky elements (filter chips, chat input, headers) remain pinned during scroll — never disappear or require scrolling back up to reach.
  - Bottom sheets (Coffee/Activity Vibe, Mr. Vibe) rise to ~70–80% of screen height, leaving the screen behind visible — never full-screen takeovers for secondary actions.
- 

## 6. Product Vocabulary (used identically everywhere, including Mr. Vibe)

| Say this                            | Not this                         |
|-------------------------------------|----------------------------------|
| Vibemate                            | Match, friend, connection        |
| Vibe Score / Vibe band              | Compatibility score              |
| My Haus                             | Friends list, connections list   |
| Chill / Balanced / Bring the Energy | Introvert / Ambivert / Extrovert |
| Coffee Vibe / Activity Vibe         | Meetup request, date             |
| Saved Vibes                         | Bookmarks, favorites             |

**No em-dashes anywhere in app copy** — use periods or commas instead. This applies to every AI-generated string as well as hand-written copy.
