

VibeHaus - Launch Plan & Monitoring Dashboard

Author: Sakshi · Capstone

Part A - Light Launch Plan (GTM)

Launch goal (v1): get the first cohort of expats in Berlin to try VibeHaus, make a real connection, and tell a friend — validating that fit-first, explained-AI matching earns trial and word of mouth.

Positioning: *Your vibe. Your people. Your city.* - warm, expat-first, depth-oriented; explicitly not a dating app and not a swipe app.

Target first users: expats and newcomers in Berlin (0–3 years), 25–40, who want *meaningful* friendships, not just events.

Channels (where expats already are - this fixes the "good tools exist but people don't find them" gap):

- Expat Facebook groups & WhatsApp communities (New in Berlin, Expats in Berlin, women's/newcomer groups).
- Berlin subreddits and Discords.
- University alumni / relocation / language-school networks.
- Expat community events
- Word of mouth + a simple "invite a friend" nudge (also helps cold-start).

Launch assumptions to test: (1) expats will trust an AI friend-matcher if the match is *explained*; (2) mutual opt-in makes reaching out feel safe enough to act; (3) depth-oriented framing out-performs a casual/nightlife tone for this audience; (4) offering a choice of on-ramp (chat, coffee, activity, or a public/private Vibe) reduces the pressure that drives people off swipe-first apps.

Stakeholders (for a real launch): expat community admins (distribution), local hosts/venues (future Hosted Experiences), and safety/trust review before scaling.

Rollout — phased, matching the finalized roadmap (*planning assumptions for a real build with developers, not the capstone sprint*):

Phase	Release	What ships	Timeline
1 — MVP	Internal Alpha (small controlled group)	Core Vibemate loop, Events (public/private), Calendar, Safety; Mr. Vibe as Stretch	Weeks 1–5
2 — Validate	Closed Berlin Beta (~50–100 invited users)	AI Icebreaker, Voice & Video, Trust & Verification, Moderation, Notifications, Live Map, Live-Conversational Mr. Vibe, Social Signals, Adaptive Recs, Language-Aware Matching	Months 2–3
3 — Scale	Soft Launch waves (10% → 25% → 50% → 100%) → Berlin Public Launch → Community	Group Vibes, Re-engagement; each wave gated by Go/No-Go	Months 4–9+
4 — Monetize	VibeHaus+ Pilot → Monetization Rollout	Epics P1–P6 (Subscription, Hosted Experiences, Payments & Billing, Premium Features, Conversion & Growth, Monetization Analytics)	Post-Scale Validation
Future Opportunities	Explored only after core roadmap validation	Multi-City VibeHaus, Newcomer Mode & Local Buddy, Neighbourhood Community, Native Mobile Experience	Not yet scheduled

Go/No-Go before each wave: product (flow reliable), user value (relevant matches, real connections), network (enough eligible matches), retention (users have a reason to return), safety (no unresolved defects), monetization readiness (revenue testing only begins once product value and retention are demonstrated) - hold the wave if any area fails materially. *(Full epic-level detail in the backlog & story map.)*

Part B - Monitoring Dashboard

Framework: activation → connection → engagement funnel, with a North Star. (*Pre-launch: targets are directional, to set a baseline from the usability test — not projections.*)

KPIs (tied to PRD §8 success metrics)

VibeHaus measures whether users move from discovering someone compatible to making a confirmed real-world plan, not whether a lasting friendship is ultimately formed (that happens outside the product). Targets marked *directional* are VibeHaus hypotheses; others reflect what's observable within the product itself, not external benchmarks.

Metric	Definition	How measured	"Good" target	Stage
★ Confirmed IRL Connection Rate (North Star)	% of accepted Vibemate connections with ≥1 accepted Coffee/Activity Vibe	$\text{accepted Coffee/Activity Vibes} \div \text{accepted Vibemate connections} \times 100$	≥20% (<i>directional</i>)	MVP
Vibemate Acceptance Rate	% of sent Vibemate Requests that are accepted	$\text{accepted requests} \div \text{requests sent} \times 100$	≥40% (<i>directional</i>)	MVP
Vibemate Request Rate	% of activated users who send ≥1 Vibemate Request	$\text{senders} \div \text{activated users} \times 100$	directional, tracked from Alpha	MVP
Activation Rate	% of new users completing onboarding + engaging with ≥1 Vibe Match	$\text{onboarded users who Like/Save/Request} \div \text{new signups} \times 100$	≥60% (<i>directional</i>)	MVP
D7 Retention	% of new users returning after 7 days	$\text{active on day 7} \div \text{signup cohort}$	~15–25% (AppsFlyer/UXCam 2025–26)	Early launch

D30 Retention	% of new users returning after 30 days	active on day 30 ÷ signup cohort	~6–10% (AppsFlyer/UXCam 2025–26)	Early launch
Free-to-Paid Conversion	% of free users upgrading to VibeHaus+	paid within ~6 months ÷ free cohort	3–5% good, 6–8% great freemium	Future (Phase 4)

Guardrail, not a KPI: Safety (Block/Report/Remove) must function reliably with no unresolved critical defects before any broader release. Chat Start Rate, Events participation, and Mr. Vibe engagement are tracked as diagnostic/product-learning signals, not success criteria — message frequency specifically is not used to define a meaningful connection, since Vibemates can choose Chat, Coffee, or Activity as their own path.

Events Tracked

The analytics events below feed the KPIs above (and safety monitoring). This is distinct from the **Events feature** (public/private Vibes) - "events" here means analytics/telemetry events, i.e. what gets logged, not what a user can create in-app.

Event	Trigger	Key properties	Feeds
signup	Account created	user_id, timestamp	Funnel top, Activation
onboarding_completed	Onboarding finished	user_id	Activation Rate
account_deleted	Delete Account confirmed	user_id	Churn
vibe_match_shown	Profile card renders in feed	viewer_id, shown_id, band	Impressions (future adaptive recs)
profile_liked	Heart tapped	user_id, target_id	Activation Rate, Engagement funnel

profile_saved	Bookmark tapped (direct or via Maybe Later)	user_id, target_id	Saved Vibes usage
search_used	Search bar used on Discover	user_id, query	Feature usage
vibemate_request_sent	Send Vibemate Request tapped	sender_id, recipient_id	Vibemate Request Rate
vibemate_request_accepted	Accept tapped	sender_id, recipient_id	Vibemate Acceptance Rate, Confirmed IRL Connection Rate denominator
vibemate_request_declined	Decline tapped	sender_id, recipient_id	Funnel drop-off
vibemate_request_cancelled	Cancel tapped by sender	sender_id, recipient_id	Funnel drop-off
vibemate_removed	Remove confirmed	user_id, target_id	Churn, safety signal
chat_message_sent	Message sent	sender_id, recipient_id, thread_msg_count	Chat Start Rate (diagnostic only, not a success KPI)
chat_deleted	Delete Chat confirmed	user_id, thread_id	Feature usage
coffee_vibe_sent / _accepted / _declined / _cancelled	Coffee Vibe lifecycle	sender_id, recipient_id, venue, datetime	Confirmed IRL Connection Rate

activity_vibe_sent / _accepted / _declined / _cancelled	Activity Vibe lifecycle	sender_id, recipient_id, activity, venue, datetime	Confirmed IRL Connection Rate
event_created	Create a Vibe submitted	host_id, event_id, public/private, mode	Event creation rate
event_joined	Join Vibe (open-to-all)	user_id, event_id	Event participation
event_join_requested / _approved	Permission- based join lifecycle	user_id, host_id, event_id	Funnel
event_cancelled	Cancel Vibe (host)	host_id, event_id	Reliability signal
event_left	Leave Event (attendee)	user_id, event_id	Churn signal
user_blocked / user_reported	Safety action	user_id, target_id, reason	Safety signal, escalation trigger
mr_vibe_opened	Floating icon tapped	user_id	Feature adoption (Stretch)
mr_vibe_match_shown / mr_vibe_no_match_fallback_ shown	Mr. Vibe result	user_id, requested_activity	Feature effectiveness, coverage gaps

Dashboard format

Built in **Looker Studio**, connected live to a Google Sheets data source (dummy data for the capstone demo, swappable for real data post-launch without rebuilding the dashboard). Two pages:

- **KPI page:** seven branded scorecards (navy/orange) for the metrics above, each showing the live value against its target.

- **Funnel page ("Signup to Confirmed IRL Plan, 60-day total"):** Signups → Completed Onboarding → Vibemate Requests Sent → Vibemate Requests Accepted → Confirmed IRL Plans, with a conversion/drop-off percentage annotated between each stage.

Simulated capstone data (60-day dummy dataset), for demonstrating the measurement framework:

Stage	Count	Converted	Dropped off
New Signups	318	—	—
Completed Onboarding	213	67%	33%
Vibemate Requests Sent	139	65%	35%
Vibemate Requests Accepted	80	58%	42%
Confirmed IRL Plans	30	38%	63%

Overall: **9.4%** of signups reach a confirmed IRL plan. Resulting KPI values on this dummy data: Confirmed IRL Connection Rate **37.5%** (target $\geq 20\%$ ✓), Vibemate Acceptance Rate **57.6%** (target $\geq 40\%$ ✓), Vibemate Request Rate **65.3%**, Activation Rate **67%** (target $\geq 60\%$ ✓), D7 Retention **24%**, D30 Retention **6%**, Free-to-Paid Conversion **0.3%** (marked as a future metric, not yet meaningful pre-launch).

Product insight from this simulated data: the steepest drop-off is between Vibemate Requests Accepted and Confirmed IRL Plans (62.5%) - people are connecting, but not always following through to an actual plan. If this pattern held with real users, it would point to *planning friction*, not *matching quality*, as the priority to fix: better Coffee/Activity Vibe prompts, Calendar nudges, and reducing the steps between "we're Vibemates" and "we have a plan," rather than tuning the matching algorithm itself.

Narrative — cadence, thresholds, decisions

- **Review cadence:** weekly during early launch.
- **Good vs bad movement:**
 - North Star (Confirmed IRL Connection Rate) rising = mutual consent and matching are genuinely converting into real-world plans; flat = people connect but rarely follow through → improve planning prompts and reduce friction, not matching.
 - Vibemate Acceptance Rate low = connections are being requested but not reciprocated → investigate matching/relevance quality.

- Vibemate Request Rate low = people see matches but hesitate to reach out → reduce first-move friction (stronger "why you might vibe" framing, lower-stakes ways to signal interest).
- (Future) Conversion / LTV:CAC weak = value isn't yet worth paying for, or acquisition costs too much → don't scale spend until the connection loop is proven.
- **Decision triggers (examples):**
 - If Vibemate Requests are sent but rarely accepted → the problem is match relevance, not outreach friction → improve matching quality, not signups.
 - If people become Vibemates but the North Star (Confirmed IRL Connection Rate) stays low → the problem is planning friction, not fit → strengthen Coffee/Activity Vibe prompts, add Calendar nudges, reduce steps to a confirmed plan.
 - If Events are created but rarely joined → the discovery/visibility of public Vibes needs work, not the creation flow.
 - **Do not** chase DAU/time-in-app — that's off-mission; success is real-world connection.
